AutoCAD uses a model-based architecture. CAD drawings may be thought of as a tree of data structures, which can be viewed and navigated in two dimensions. Although it is possible to generate a drawing from scratch, in many cases it is desirable to create a file of related drawings that can be modified and reused. This is done by using a drawing template, a specific kind of data structure. The basic data structure of a template is a collection of objects. The template may have its own set of objects which the user may edit, and it may also have one or more associated source drawings. Data in the source drawings will become part of the template and thus become editable in the template. If the source drawing is used for multiple templates, the drawings may be associated by specifying a "template reference" which links the source drawings to the associated template. Each time a new template is generated, a new template reference is created which will automatically point to the associated source drawings. The database of objects in a template is a tree of objects. Each leaf of the tree is an object, and the root of the tree is the template. At any time there may be one or more instances of the template (one per drawing or other shared drawing). Template-based drawing creation When a template is loaded into AutoCAD, the drawing area is initialized with a default set of objects. To set up a drawing, the user can create objects from the initial default set or may use the Edit Object dialog. The Edit Object dialog is accessed by clicking the + sign at the bottom of the screen. It allows users to browse the default set of objects and create new ones. Creating drawings based on templates Once the user has edited the drawings, the next step is to save them. To do this, the

user chooses the right hand panel (Control Panel) and then selects the Save As option, either from the File menu, or by choosing File > Save As from the menu bar. After making the selection, the user is prompted for a new name and location for the new file. To save a template, the user chooses File > New Template from the menu bar, and then selects the appropriate template from the drop-down menu. The user can then add drawings or edit existing drawings. The user may also add additional objects, and create new drawings by choosing File > New from the menu bar. Any time drawings are edited, they are saved as a new version of the template a1d647c40b

Sarcocystis simus n. sp. in jungle fowl (*Gallus gallus*). A species of *Sarcocystis* that in the present study was found in wild jungle fowls (*Gallus gallus*) is described as *Sarcocystis simus* n. sp. Parasites were found in 2 of the 100 jungle fowls examined, both in the skeletal muscles. In one bird, sarcocysts were found in the thigh and in the other, they were present in the neck muscle. The sarcocysts measured 4.9 x 4.2 microns and showed a sausage-shaped sarcocyst wall, a granular cytoplasm, a granular and smooth cytoplasmic wall, and numerous bradyzoites. The sporocysts measured 9.4 x 6.5 microns and their wall was covered with numerous small granules. In view of the results of the present study and the similarities between the present species and *Sarcocystis capracanis* from the common ground dove (*Columbina passerina*), the latter being the only species of *Sarcocystis* with this type of a wall, *S. capracanis* should be considered a synonym of *S. simus* n. sp. in jungle fowl.
