****Layer and Layer Masks**** Layers are the foundation of Photoshop and the backbone of all design. Under the Layers menu, you can create, manage, and modify multiple layers. Photoshop also enables you to create layer masks for any layer. A _layer mask_ is a semi-transparent overlay layer that can be used to selectively hide and reveal individual pixels in the layer's area. When you apply a layer mask, the pixels that are not covered by the mask become transparent and the pixels covered by the mask become opaque. When you apply a layer mask, you create a new layer with a mask. For example, a layer mask masks

Modification of PPARgamma protein results in altered lipogenic gene expression in HepG2 cells. Peroxisome proliferator-activated receptor-gamma (PPARgamma) has been implicated in gene regulation of a variety of metabolic pathways, including fatty acid, lipoprotein, and glucose homeostasis. Here we showed that human PPARgamma isoform in HepG2 cells was expressed in two isoforms of 84 and 92 kDa. The treatment of HepG2 cells with ligands of both nuclear and/or receptor forms of PPARgamma resulted in up-regulation of fatty acid synthase (FAS), acetyl-CoA carboxylase (ACC), fatty acid-binding protein-4 (FABP-4), and stearoyl-CoA desaturase-1 (SCD-1), while changes of fatty acid-binding protein-7 (FABP-7) expression were not detectable. The FAS gene was sequenced and the presence of a novel PPRE was found, which was located at the 5'-flanking region of the human FAS gene. The results revealed that a cAMP-responsive element-binding protein (CREB) and several co-activators are required for PPARgamma-dependent transactivation of the FAS gene in HepG2 cells.

Q: About the proof of $\sum_{n=1}^{\infty} \frac{\log(n)}{n}$ convergence $\sum_{n=1}^{\infty} \frac{\log(n)}{n}$ convergence We can easily prove $\sum_{n=1}^{\infty} \frac{\log(n)}{n}$ convergence. $\sum_{n=1}^{\infty} \frac{\log(n)}{n} \leq \sum_{n=1}^{\infty} \frac{1}{n} = \infty \rightarrow \sum_{n=1}^{\infty} \frac{\log(n)}{n}$ convergence. $\sum_{n=1}^{\infty} \frac{\log(n)}{n} \geq \sum_{n=1}^{\infty} \frac{1}{n} = \infty$

The study, which looked at 500 economists, found that the total net worth of the top 20% of Americans is equal to 60% of total wealth in the US. On the other hand, the bottom 20% controls just 4% of it. The study: Backed by Harvard University, the university's Kennedy School of Government and the National Bureau of Economic Research, the study was led by economists, Barry Bluestone, a senior lecturer at the school and a former managing director of the Economist Intelligence Unit, and Northeastern University economist Richard Freeman. The team used data from the Census Bureau's Survey of Consumer Finances in 2011 and 2012 to create a measure of wealth that includes both household income and the value of home equity. Their data and calculations were based on the full individual asset and liabilities measured by the survey, including pension plans and stock holdings, and real estate values. The researchers did not consider companies or financial institutions, such as banks. "In the aggregate, our estimate of the total wealth of households in the bottom 20 percent
