.fmt.jpeg) The competition in image editing hasn't abated, but in recent years, several high-quality applications and editors have emerged. The situation is improving, though, as more of the existing programs get updated with new features. The problem with Photoshop Today's Photoshop may be powerful, but its interface is far from user-friendly, and it doesn't take advantage of the Internet. That's because Photoshop's developers are working on a completely new program. They're calling it Photoshop CS6. Although Photoshop CS5 will be available when CS6 is released, you'll need to buy CS6 to get the most out of it. After you purchase a copy of Photoshop CS6, expect to spend several weeks learning the program. Much of Photoshop's interface is patterned after the appearance of an Apple Macintosh operating system, complete with applications. Because you're still in the early stages of learning Photoshop and mastering the software, this feature can be confusing. The learning curve is steep, and Photoshop isn't the easiest program to figure out for beginners. To the disappointment of many photographers, Photoshop is a monolithic program. It takes up a lot of storage space, and the sheer size means that you have to install it on your hard drive. Although Photoshop can open image files from a number of applications, it does it better than most — and as you develop your skills, Photoshop can help you create more and more complex effects and manipulate more and more files. Actions and Photoshop Photoshop has several other problems that affect its user interface and overall efficiency, though. Actions are the answers to many of these issues. A Photoshop action is a single command or series of commands — one action is a single command on a single layer. For example, a Flashlight action might create a tint over an image with a blue cast to the shadows. An Adjust Camera Blur action might remove some of the blur from the image, even if the camera in use isn't capable of creating that type of blur. Photoshop offers several actions. You can access these actions by choosing File⇒Automate⇒Actions⇒Actions Editor⇒Actions List. Photoshop makes it easy for you to create actions. All you do is follow the prompts to create a new action. You can add multiple actions to an image and then create new layers and Photoshop actions that work in tandem. The Photoshop actions dialog box is shown in Figure 7-1.

[A Case of Metachronous Multiple Lung Cancer with Sensitive to Drugs Successively Stabilized]. A 54-year-old female underwent right upper lobectomy and partial pneumonectomy for right lung cancer in April 2014, and chemotherapy( S-1 + paclitaxel, 3 courses)was administrated postoperatively for lung metastasis( pT1N3M1, R2, Stage IV, cStage 3b ). The patient developed a brain metastasis and brain chemotherapy( vemurafenib)was administrated postoperatively( December 2014). However, she developed multiple lung metastasis and lung partial resection was performed( February 2015). She underwent adjuvant chemotherapy( sunitinib)and also survived without recurrence for 11 months. She was admitted to our hospital for diarrhea and pulmonary atelectasis( March 2017).Q: The probability of having 0 good days in a week out of 30 So I'm supposed to calculate the probability of having 0 good days out of 30 days for a given person. This is what I came up with:  $P(\text{having } 0 \text{ good days}) = \sum P(\text{good day } \times \text{space even} \times \text{space day}) + P(\text{bad day } \times \text{space on } \times \text{space even} \times \text{space day}) + P(\text{good day } \times \text{space on } \times \text{space odd} \times \text{space day}) + P(\text{bad day } \times \text{space on } \times \text{space odd} \times \text{space day})$  Each of the four cases has a probability of  $\frac{1}{2}$ , so we end up with:  $P(\text{having } \text{space } 0 \text{ space good } \text{space days}) = \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = \frac{5}{2}$  Is this the correct way of going about the problem? A: I'd just use permutations. Since, in the given order, the \$0\$ good days are \$1\$ bad day, \$1\$ good day and \$0\$ good days and the \$30\$ are equally distributed, by the binomial theorem, we have:  $\sum_{k=0}^{30} P(\text{good,days}) = \sum_{k=0}^{30} \binom{30}{k} \cdot \frac{1}{2}^k \cdot \frac{1}{2}^{30-k} = \sum_{k=0}^{30} \binom{30}{k} \cdot \frac{1}{2}^{30} = \frac{1}{2}^{30} \cdot \sum_{k=0}^{30} \binom{30}{k} = \frac{1}{2}^{30} \cdot 2^{30} = 1$  All the expensive gadgets, the high-class travel and

### What's New in the?

1. Technical Field The present invention relates in general to an improved circuit for fault injection, and in particular to an improved adjustable fast-slow fault injection circuit. Still more particularly, the present invention relates to a method and apparatus for dynamically adjusting a fast-slow fault injection system according to a fault sensitivity of a fault injection circuit to maintain a level of fault injection at a desired level. 2. Description of the Related Art With the advent of integrated circuit manufacturing technology, it is possible to generate a defect on the order of one or two defects per billion die. These defects take the form of open circuited (hereinafter, open fault) or short circuited (hereinafter, short fault) circuits that disrupt normal circuit operation. One way to understand these defects is that either the current cannot flow, or enough current will flow to result in a short circuit. This has become problematic in that as integrated circuit devices have become smaller and faster, the open and short fault currents are becoming larger than the system current. One way to explain the severity of these open and short faults is to consider the netlist of the integrated circuit. A netlist is a listing of all of the circuit elements (also referred to as nodes) and the interconnections of these circuit elements. These interconnections take the form of interconnections between nodes or edges (sometimes referred to as interconnections between circuit elements). In particular, it is possible to have interconnections between circuit elements even within a same node. These interconnections are typically represented as if there is a wire that connects the nodes. The presence of this wiring, and the fact that the integrated circuit device may have a large number of nodes, results in an enormous number of interconnections. For example, a typical integrated circuit device may have 100,000 nodes and have more than 500,000 interconnections. As a result, a single defect in the integrated circuit can occur in thousands of nodes, and hundreds of thousands of connections. While it is possible to create fault models, the modeling of the integrated circuit is still an art, and the required models are often constrained by available circuit test time. That is, the detection of a fault is performed over an entire integrated circuit. Depending on the type of fault, a significant portion of the circuitry may still be intact. Furthermore, integrated circuit manufacturers test integrated circuits at various levels of severity. These levels include fully functional devices, functional devices, probabilistic devices, and fault injection
